Representing the two numbers 3768 and 25.6 in the place value grid, we get

3768	Th	H	T	O
	3	7	6	8

25.6	Tens	Ones	Tenths
	2	5	6

In the beginning of this chapter, we came across the discussion about the length of the pencils of Kavin and Kala. Those lengths can also be represented in the place value grid as follows.

Length of Kavin's pencil is 4 and 5 tenths of a cm

Place value		
4.5	Ones	Tenths
	4	5

Length of Kala's pencil is 4 and 3 tenths of a cm

Place value		
4.3	Ones	Tenths
	4	3

We know that the digit to the right of ones place is known as tenths and the point is called decimal point which separates the integral part and decimal part of a number.

In the above situation, we have expressed numbers with one decimal digit in place value grid. Now to express numbers with two decimal digits in place value grid, let us consider the example already discussed in the introduction part.

Ravi has purchased dress materials for pongal festival. The length of the pant material is 4 m 75 cm. To express the centimetre in terms of metres, we proceed as follows.

We know that

$100\ cm = 1\ m$

$1\ cm = \frac{1}{100}\ m$

X4Z7B9

Therefore one centimetre can be represented as one hundredth of a metre.

Similarly, $75\ cm = \frac{75}{100} = 0.75\ m$

So the length of the pant material is $4 + 0.75\ m$

That is 4.75 m. It can be read as four and seventy five hundredth of a metre or four point seven five metres.

Note

The decimal digits of a number have to be read as separate digits.

Try these

1. Express the following decimal numbers in an expanded form and place value grid form.

   (i) 56.78 (ii)123.32 (iii)354.56
