Let us do the division of 2.48 by 2 in the other way.

Observe the following figure.

Consider 2 wholes, when you divide 2 wholes equally in groups of two's, each group gets 5 such groups which represents 1 whole.

Next consider the tenth, taking four tenth and dividing it in group of two's, we get two such groups and each group represents two tenth.

Finally, dividing 8 hundredth in group of two's, each group has 4 hundredth.

Therefore 2.48 ÷ 2 = 1 whole 2 tenth 4 hundredth

= 1.24.

Example 1.23 Divide 6.3 ÷ 3 using area model.

Solution

The decimal number 6.3 is shown in *Fig. 1.12.*

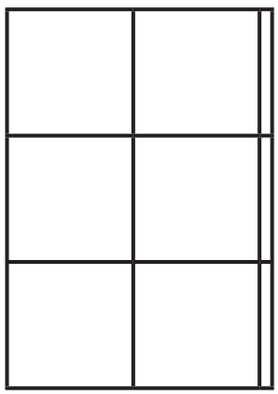

Fig. 1.12

Since 6.3 is divided by 3, we seperate the areas into 3 equal groups using three different colours as in *Fig.1.13.*

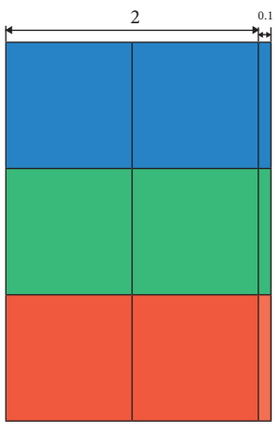

Fig. 1.13

Each group to represents 2.1, which is the quotient.

Therefore, 6.3 ÷3 = 2.1.
