For example, take 52.16 ÷ 4

Now, let us divide 5216 by 4.

$\frac{5216}{4} = 1304$

Now there are 2 decimal digits in the dividend. So the quotient also will have two decimal digits.

Therefore, 52.16 ÷ 4 = 13.02

Try these

Find the value of the following.

(i) 46.2 ÷ 3 = ?

(ii) 71.6 ÷ 4 = ?

(iii) 23.24 ÷ 2 = ?

(iv) 127.35 ÷ 9 = ?

(v) 47.201 ÷ 7 = ?

Example 1.24 Sugarcane juice of 1.5 *l* has to be shared equally among five members. What is the share of each member.

Solution

Quantity of sugarcane juice = 1.5 *l*

Number of persons to be shared = 5.

Individual share $= \frac{1.5}{5} = 0.3\ l$

Therefore, the individual share is 0.3 litres.

Fig. 1.14

(iv) Division of a Decimal Number by another Decimal Number

Kavitha wants to distribute groundnut balls to all her classmates on her birthday. She has ₹61.50 in her piggy bank. If each groundnut ball costs ₹1.50, how many balls she can get with that amount? In real life, there are situations in which we need to divide a decimal number by another decimal number.

(i) Consider, 15.5 ÷ 0.5

$$15.5 \div 0.5 = \frac{15.5}{0.5} = \frac{\left(\frac{155}{10}\right)}{\left(\frac{5}{10}\right)} = \frac{155}{10} \times \frac{10}{5} = 31$$

Thus, $\frac{15.5}{0.5} = 31.$

(ii) Let us consider 62.5 ÷ 0.25

Now $62.5 \div 0.25 = \frac{62.5}{0.25}$

Since $62.5 = \frac{625}{10}$ and $0.25 = \frac{25}{100}$ we get,

$$\frac{62.5}{0.25} = \frac{\left(\frac{625}{10}\right)}{\left(\frac{25}{100}\right)} = \frac{625}{10} \times \frac{100}{25} = \frac{625 \times 10}{25} = \frac{6250}{25} = 250.$$
