ACTIVITY 11

You need Gelatin papers of Red, Blue and Yellow. Fold each gelatin paper three times and look different colour objects listed below through each folded paper. Observe what colour each object has. Write your observations in the table.

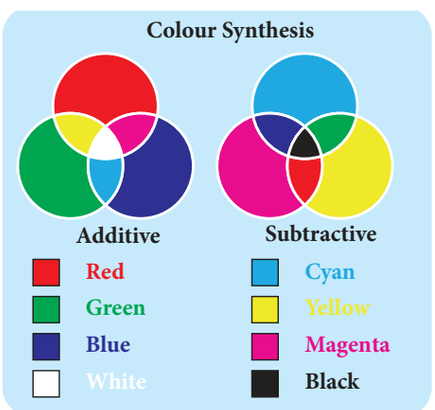
Object	Original colour of object	Colour through Red gelatin paper	Colour through Blue gelatin paper	Colour through Yellow gelatin paper
Blue sky				
Orange flower				
Yellow banana				
leaves				
Brown trouser				
White shirt				
Black board				

We know that white shirt will reflect white light and we have seen that white light consists of different colours. When we look at the white shirt through the yellow gelatin paper, we see it as yellow in colour. From this, we can say that the yellow gelatin paper did not allow any other colour except yellow to pass through. Similarly, we conclude that red gelatin paper allows only red light and blue gelatin paper allows only the blue light.

Synthesis of colour

Synthesis of colour is the method of creating colour by mixing various proportion of two (or) three distinct colours of light. These distinct colours are Red, Green and Blue called as **primary colours.**

- Equal proportions of two primary colour create a secondary colour.
- Magenta, Cyan and yellow are called **secondary colours**.



1 Red	+	1 Blue	=	Magenta
1 Blue	+	1 Green	=	Cyan
1 Green	+	1 Red	=	Yellow

- Equal proportions of all three primary colour create white.

1 Red	+	1 Blue	+	1 Green	=	White
