As civilization progressed the early astronomers found two types of motion of celestial objects. Let us take the case of Moon. On a daily basis Moon appears to rise in the east and set in the west. Thus, one can say that Moon is going around the Earth with a period of one day. But for a careful observer, it was clear that the Moon was also exhibiting another motion. Suppose, the Moon is appearing in the sky today near the star Asvini, tomorrow we will observe that the Moon is near the star Bharani, a star east of Asvini. And the next day it will be near the star Kartikai, east of Bharani. After 27 days, moving little by little eastwards, the Moon again stations itself near asvini. Thus, everyday Moon appears to move from east to west in one day where as it appears to go in a circle from west to east in the background of stars in about 27 days.

These two motions were puzzling. Very soon astronomers like Aryabhata said that Earth is spinning in its axis, that is the cause of apparent daily motion from East to West. Whereas the eastward motion of Moon in the celestial sphere with a period of about 27 days, was seen as the 'actual' motion of the celestial objects.

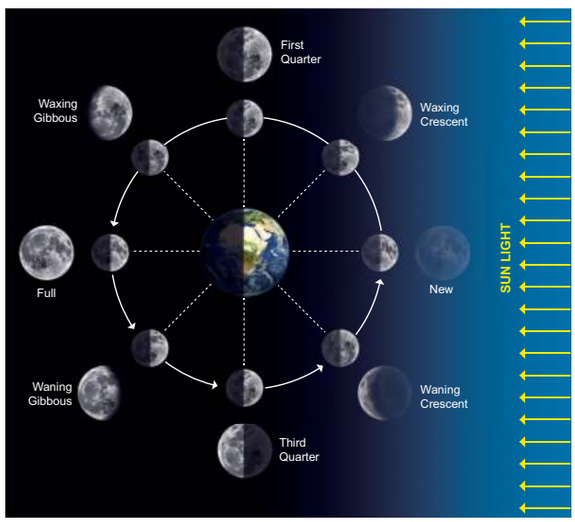

Thus, the geocentric model (also known as geocentrism), that is a description of the Universe with spherical and spinning Earth at the center and the Sun, Moon, stars, and planets all orbits the Earth emerged in various cultures. In Greece, this model was put forth by the Greek philosopher Plato and his disciple Aristotle in 6th century B.C. It was standardized by a Greeco Roman mathematician Ptolemy in the 2nd Century A.D. A similar model is seen in the Siddhanthic astronomy in India like Aryabhateeyam of Aryabhata.

**How Moon exhibit phases?**

Astronomers in ancient times also observed certain facts. The Purananuru (65) of Sangam literature, the Poet Kalathalaiyar singing in appreciation of Cheraman Peruncheralathan says,

"On the day when the full Moon appears, the Sun and Moon look at each other with their bright light. In the evening time, one sphere hides behind the mountains."

On the full Moon day, when the Sun is setting in the west, precisely at the same time, Moon rises at the East. That is both Sun and Moon are in the opposite side. Likewise when it is waning half Moon, the Moon rises when it is midnight and the waxing half Moon rises during noon. From such observations and modelling ancient astronomers could explain why we have waxing and waning of Moon.

It is probably easier to understand the waxing and waning of Moon in the order of new Moon & full Moon and then how the first and third quarter Moon (half Moon) appear and then the phases in between.

Sun is the source of light. Sun light falls on the spherical Earth, but only on the side facing
