Sun. The opposite side of Earth is without sunlight. As the Earth spins day and night follows as different parts of Earth appear before the Sun. That is at all times one half of Earth is illuminated by Sun and one half is in darkness.

Likewise at all times one half of Moon is illuminated by Sun and the opposite side is shroud in darkness.

As shown in the diagram, when the Moon is positioned between the Earth and Sun, notice all the illuminated part of Moon is away from Earth. Hence we cannot see any part of the illuminated side of the Moon. Only the dark side of Moon is towards Earth. When the Moon is in this position, we have new Moon.

Now look at the Moon when it is behind the Earth. Now the portion of the Moon illuminated by Sun is totally towards Earth. The dark side is away from the Earth. This means the Moon will appear to be round in the sky. This is full Moon.

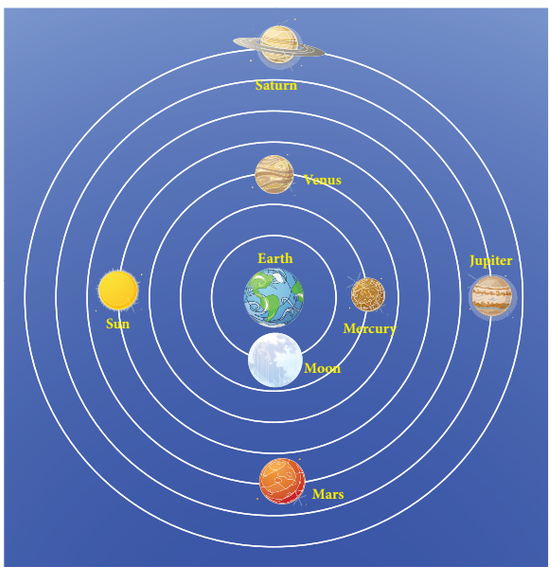

When the Sun, Earth and Moon are in 90 degree angle how will the Moon appear to a person on the surface of the Earth? Now if you look at the portion of Moon facing Earth, we will see half if it illuminated and half is dark side. Thus, the Moon will appear as half Moon. The half Moon during the waxing period is called as first quarter and the half Moon during the waning period is called as third quarter. (Figure: Sun, Moon and Earth are at right angles)

Once we understand those four key Moon phases, the phases between them should be fairly easy to visualize.

The word **crescent** refers to the phases where the Moon is less than half illuminated. The word **gibbous** refers to phases where the Moon is more than half illuminated. Waxing essentially means "growing" or expanding in illumination, and waning means "shrinking" or decreasing in illumination. Note all so that these discoveries could be made with naked eye. You do not need telescope or any modern equipment.

Geocentric model

Moon going around Earth with 27 days period nicely explained its motion. However astronomers in ancient times faced problem in explaining the motion of the then known five planets - Mercury, Venus, Mars, Jupiter and Saturn.

Moon in the background of stars moved everyday eastwards nicely. However for example, if we were observing the motion of Mars from January, it would appear to move
