Difference between Antiseptic and Disinfectants	
Antiseptic	**Disinfectants**
1. All antiseptic are disinfectants.	All disinfectants are not antiseptic .
2. It can be applied on the live tissues.	It can be applied on inanimate object.
For example. Skin / Mucous.	For example. Surface, lab working tables, floor.

4.7 Antihistamine

Anti histamines are defined as drugs that combat the histamine in the body that are used for treating allergic reactions and cold symptoms. Histamine is a chemical messenger involved in number of complex biological reactions. When a foreign body such as pollens enters the body, the immune system believes those substances to be harmful and generates the release of histamine. When histamine is released, it will interact with the histamine receptors on the cell surface or within a target cell and cause changes in the bodily functions. This stimulates many smooth muscles to contract, such as gastrointestinal tract and bronchi. In certain smooth muscles, they cause relaxation of blood capillaries which increase the flow of lymph and its protein content and lead to the formation of edema (redness and rashes).

Antihistamines or histamine receptor antagonists oppose selectively all the pharmacological effects of histamines. For, Ex. Diphenhydramine, chlorpheniramine, cimetidine. The adverse effects of antihistaminics are mouth dryness and sleepiness.

Medicine:

Medicines are used to treat the disease and to improve our health.

"Diagnose the disease and understand its seeds; Identify the cause and make sure it succeeds".

Medicine is the science or practice of the diagnosis, treatment, and prevention of disease. There are many ways to intake the medicine.

1. Oral use
2. External use
3. Injections (Intra muscular/Intra venous)

The medicines we take treat our disease and lead us to a good health.
