When the grains of sand are very fine and light, the wind can carry it over very long distances. When such sand is deposited in large areas, it is called ***Loess***. Large deposits of loess are found in China.

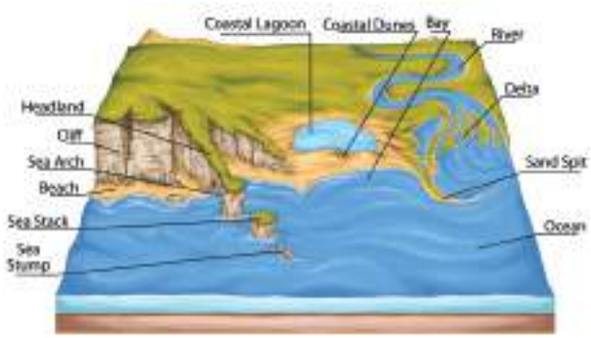

Loess

Northern China loess deposits are brought from the Gobi Desert.

Sea waves

A part of the land adjoining or near the sea is called the **Sea coast**. The boundary of a coast, where land meets water is called the **Coast line**. The coastal areas are subject to change due to wave erosion and wave deposition.

Coastal Landforms

The erosion and deposition of the sea waves give rise to coastal landforms. ***Sea Cliffs*** are steep rock faces formed, when the sea waves dash against them. Sea waves continuously

Sea Cliff

strike at the rocks. So Cracks develop. Over time they become larger and wider. Thus, hollow like caves are formed on the rocks. They are called ***Sea Caves***.

Sea cave

As the cavities of sea caves become bigger and bigger only the roof of the caves remains, thus forming ***Sea Arches***. Further, erosion breaks the roof and only walls are left. These wall like features are called ***Sea Stacks***.

Sea arch and Sea stack

The sea waves deposit sediments of sand and gravel along the shores forming **Beaches**. **Sand bar** is an elongated deposition of sand or mud found in the sea, almost parallel to the coast.
